How to Propagate Fruit Trees and Vines from Cuttings

These are dormant cuttings, taken in winter after the mother plant loses its leaves.

Some plants can be propagated from cutting some are propagated via grafting. I'll put a list in the description for you.

See my grafting video to learn about scion wood and grafting.

Even if you don't cut near the bud it will produce roots from the bottom But it will be harder for the cutting.

And helps to protect from fungus or other things that could hurt root growth.

Synthetic rooting hormone also uses fungicide to prevent rot. This damages the soil life and trees NEED healthy soil fungi to have optimal health.

Plants that don't require intervention are healthier from the beginning and likely to be healthier in the

long run.

Great natural rooting hormone options: Honey, aloe vera, or willow water

You can plant into straight compost or a nice potting mix. Either will work.

Once cuttings wake in spring, allow to leaf out well to ensure large root structure before potting on or transplanting.
