ONLINE PAYMENT SOLUTIONS

In the first Russian textbook on electronic payments Dmitry Artimovich summarized his ten-year experience in the field. Online Payment Solutions uncovers the nuances of acquiring and analyzes in detail the rules of Visa and MasterCard payment systems. This book is conceived as a tutorial for people professionally working in the field of Internet acquiring, experts in online trade, as well as for the general public interested in the topic of electronic payments. The textbook focuses on the emergence of international payment systems and the reasons that put them on that particular path of development. Each chapter is supplemented with questions for self-control, allowing the reader to

use it as a textbook. In addition, the author attempts to reveal the weaknesses and peculiarities of the development of payment card payment systems in Eastern Europe, as well as the imperfections of the Russian and European legislation. The book contains an extensive comparison of the implementation of payment system rules in different countries.

Pricing Debit Card Payment Services

This paper presents a theoretical framework for analyzing pricing structures in debit card schemes featuring cardholders, retailers, their respective banks, and a network routing switch. The network routing switch controls the electronic debit card network and is jointly owned by the banks. In setting its prices, it needs to consider getting both consumers and retailers to participate in the market. In this two-sided market for debit cards, we show that the "double-monopolistic" network routing switch may want to supply consumers with cheap debit cards, deriving profits from charging a high retailer fee per transaction. This theoretic result resembles the current practice in the Netherlands where consumers pay no transaction fee, but retailers do. This corner solution carries over when we analyze socially optimal pricing.

Card, Internet and Mobile Payments in Finland

Retail payment methods are in a stage of rapid development. New service providers and technological developments enable new payment services through a variety of channels. Payment solutions are being developed based eg on the Internet and on mobile phones. Presumably, the use of paper-based payment instruments will decrease further in the future thanks to electronification in the retail payment area. In this paper we focus on card payments in Finland and certain other countries. We also look at Internet- and mobile-based payments and discuss some of the challenges related to the new solutions. The paper ends with a brief discussion of recent changes in Finnish legislation in connection with retail payments. Key words: retail payments, payment cards, Internet payments, mobile payments.

Acquiring Card Payments

This book delves into the essential concepts and technologies of acquiring systems. It fills the gap left by manuals and standards and provides practical knowledge and insight that allow engineers to navigate systems as well as the massive tomes containing standards and manuals. Dedicated to card acquiring exclusively, the book covers: Payment cards and protocols EMV contact chip and contactless transactions Disputes, arbitration, and compliance Data security standards in the payment card industry Validation algorithms Code tables Basic cryptography Pin block formats and algorithms When necessary the book discusses issuer-side features or standards inasmuch as they are required for the sake of completeness. For example, protocols such as EMV 3-D Secure are not covered to the last exhaustive detail. Instead, this book provides an overview, justification, and logic behind each message of the protocol and leaves the task of listing all fields and their formats to the standard document itself. The chapter on EMV contact transactions is comprehensive to fully explain this complex topic in order to provide a basis for understanding EMV contactless transaction. A guide to behind-the-scenes business processes, relevant industry standards, best practices, and cryptographic algorithms, Acquiring Card Payments covers the essentials so readers can master the standards and latest developments of card payment systems and technology

Developing and Managing a Successful Payment Cards Business

The credit card industry today is a multi-trillion dollar business that employs hundreds of thousands of people across the globe and impacts literally billions of people every day. Yet there is no comprehensive book or reference material available in the marketplace that provides fact-based perspectives on how to develop and manage a successful card business - despite the significant demand from all those involved in the industry. Developing and Managing a Successful Payment Cards Business offers information, analysis, observations, perspectives and advice on developing and managing a card business. There is comprehensive coverage of all areas including card business strategy, product development, customer acquisition and retention strategies, and product marketing techniques. The book also reviews underlying infrastructure components relating to operations and systems including risk management and transaction processing and suggests improvement techniques. There is detailed discussion on portfolio performance and profitability evaluation, as well as new technology developments and emerging payment systems such as chip cards and mobile payments.

E-payment

The volume of payments handled electronically has increased dramatically in recent years, as have liquidity, volatility and the amount of money flows across borders. This important global trend works together with a growing integration in corporate business processes, and a convergence in network architecture as e-payment of all kinds moves to Internet protocol systems. The net result is a new e-payment landscape that presents daunting challenges on many levels, as well as exciting opportunities, for banks, businesses and governments. Consumer and citizen interests are also at stake. This book takes a unique, wholly integrated look at the e-payment landscape, understanding the way that existing systems are being stretched and challenged. Credit card systems are extended to facilitate Internet-based eCommerce. Consumers are becoming accustomed to using their stored-value mass transit cards to make payments for goods and services. Corporations put pressure on banks to integrate business information into their electronic payment processes. New non-financial players emerge holding important floats and many of these players are challenging for key parts of the banking franchise. This bo

Implementing Electronic Card Payment Systems

As magnetic stripe cards are being replaced by chip cards that offer consumers and business greater protection against fraud, a new standard for this technology is being introduced by Europay, MasterCard and Visa (EMV). This volume presents a comprehensive overview of the EMV chip solution and explains how this technology provides a chip migration path, where interoperability plays a central role in the business model. The work offers an understanding of the security problems associated with magnetic stripe cards, and presents the business case for chip migration. Moreover, it explains the implementation of multi-application selection mechanisms in EMV chip cards and terminals, and shows you how to design a multi-application EMV chip card layout.

Cost Recovery and Pricing of Payment Services

Being able to make and receive payments is an essential facet of modern life. It is integral to the banking and finance systems, and it touches all global citizens. In some areas, payment systems are rapidly evolving – moving swiftly from paper payment instruments, to electronic, to real-time – but in others, underdeveloped payment systems hold back economic and social development. This book is intended to assist the reader in navigating the payments landscape. The author explores highly topical areas, such as the role of payment systems in enabling commerce to contribute to the development of emerging economies, the evolution of payment systems from paper instruments to computerization, the role of cryptocurrencies, and the slow decline of plastic credit and debit cards owing to alternative forms of payment being introduced. Altogether, this book provides a comprehensive overview of the evolution of payment and offers projections for the future, encouraging readers to explore their own predictions, using the framework that the book has provided. It is vital reading for technologists, marketers, executives and investors in the FinTech sector, as well as academics teaching business and technology courses.

A Global Guide to FinTech and Future Payment Trends

Bachelor Thesis from the year 2010 in the subject Business economics - Business Management, Corporate Governance, grade: A, King`s College London, language: English, abstract: Credit cards have become a popular payment system used in many UK universities. Students in universities are turning to credit card companies for financial assistance with the aim of boosting their income and building credit history. This dissertation delves into the issue of marketing financial services of

credit cards receptive to university students in UK. Chapter 1 presents the background of research, aims and objectives, and justification of study. The main aim of this research is to investigate the attitudes of students towards credit card services, and present student friendly promotional strategies expected from financial institutions. Chapter 2 provides an analysis of literature on the emergence of marketing financial services in UK and major aspects of credit card services in universities. This research integrates questionnaires with secondary sources, as discussed in chapter 3. The major findings in chapter 4 indicate that many students are not satisfied with credit card services because they lack financial knowledge. Further analysis in chapter 5 indicates that banks need to focus on financial education, personal selling, and internet marketing when promoting credit cards. Banks should collaborate with universities to promote credit card services and establish a long time relationship with students.

Financial Services Marketing Of Credit Card Receptive To University Students In UK

The rise of Fintech and crypto-assets in the payments sector presents new opportunities and challenges for firms, regulators and policymakers, and the law is continually changing to keep pace with these developments. This book provides an overview and practical examination of key areas of payments law and regulation in the EU and UK, as well as introductions to analogous legal regimes in the United States, Hong Kong, Singapore and sub-Saharan Africa.

FinTech, especially digital payments, is a fascinating space. More than trillion dollars' worth of digital payments are done, and we are 'just getting started'. Online payments space is attractive and intriguing to many. A young graduate wants to build a career in this domain, a user wants to know how payments are done and a merchant wants to know the processes. Just like India, full of diversity, even India's payments ecosystem is full of different types of payment instruments, payment service providers, and solutions that adhere to complex processes while getting constantly shaped and re-shaped by Government, RBI, new business models, and other market forces. One can refer RBI website or read Visa documents or NPCI's product specs to learn. But those documents are far too technical and loaded with heavy jargons. The blogs of the FinTech companies are more like sales pitches than giving neutral understanding about the topic. How can one go about learning about this domain? I had that question when I started my career in FinTech. Over the years, I learnt from others and from experience. Based on my learnings, I started a blog 'Auth n Capture'. After more than 2 years and ~60 articles later, here I am writing this book. This book is a beginner's guide for FinTech enthusiasts and professionals to understand the basics of India's payments ecosystems.

Merchant fees and reward programs generate an implicit monetary transfer to credit card users from non-card (or ¿cash¿) users because merchants generally do not set differential prices for card users to recoup the costs of fees and rewards. On average, each cash-using household pays \$151 to card-using households and each card-using household receives \$1,482 from cash users every year. The payment instrument transfer also induces a regressive transfer from low-income to high-income households in general. The authors build and calibrate a model of consumer payment choice to compute the effects of merchant fees and card rewards on consumer welfare. Reducing merchant fees and card rewards would likely increase consumer welfare.

Who Gains and Who Loses from Credit Card Payments?

Merchant fees and reward programs generate an implicit monetary transfer to credit card users from non-card (or 'cash') users because merchants generally do not set differential prices for card users to recoup the costs of fees and rewards. On average, each cash-using household pays \$151 to card-using households and each card-using household receives \$1,482 from cash users every year. Because credit card spending and rewards are positively correlated with household income, the payment instrument transfer also induces a regressive transfer from low-income to high-income households in general. On average, and after accounting for rewards paid to households by banks, the lowest-income household (\$20,000 or less annually) pays \$23 and the highest-income household (\$150,000 or more annually) receives \$756 every year. We build and calibrate a model of consumer payment choice to compute the effects of merchant fees and card rewards on consumer welfare. Reducing merchant fees and card rewards would likely increase consumer welfare.

Designing Mobile Payment Experiences

Inhaltsangabe:Abstract: Mobile payment (mPayment) can be understood as every payment where at least one participant applies mobile phone technology, thus, uses a mobile phone. But due to technological progress it seems reasonable to classify other devices like a Personal Digital Assistant (PDA) or devices with embedded Radio Frequency (RF) technology as mobile payment devices. However, mobile phones today clearly outnumber every other mobile payment device. Penetration rates are forecasted to reach almost 80% in Europe by 2005. The number of worldwide cellular subscribers is expected to pass one billion by 2003. By 2005 there will be more mobile phones worldwide than TVs, fixed line phones, and Personal Computers (PC). Driven by the increasing penetration and resulting business opportunities, numerous mPayment solutions have been offered by payment service providers, telcos, and financial institutions. The variety of applicable technologies, the possible linkage between the financial instruments, and the mPayment device combined with different payment scenarios offer a wide landscape of mPayment solutions. Besides technology, questions dealing with consumer expectations, factors thriving or inhibiting a widespread adoption, and with it related penetration strategies for payment service providers have to be carefully researched to develop a successful mPayment. Based on diverse motivations and influenced by recent technology development banks, telcos and start-up companies endeavour to build a successful mPayment that meets the expectations of consumers and merchants. The research question of this paper focuses on factors that can be identified as crucial to drive the success of mobile payment systems. Therefore, the first goal is to give an introduction to the mPayment landscape as a foundation for further research. The second goal is to derive key factors influencing the success of an mPayment from theoretical models and by reviewing related literature. The research concentrates on business to consumer (B2C) and consumer to consumer (C2C) payment on the European and United States (US) market. Neither cross border payments nor business to business (B2B) payments are described in this paper. The Book of Payments

Master's Thesis from the year 2006 in the subject Computer Science - Commercial Information Technology, grade: A, UNITEC New Zealand, 129 entries in the bibliography, language: English, abstract: digiPROOF is a payment system which is based on biometrics and allows customers to pay with their fingerprint. EDEKA, a big German supermarket chain has introduced the digiPROOF system in one of their stores to test how customers accept the system. Up to now, customer reactions have been very positive and EDEKA is at the moment implementing the system in several other stores and plans to roll out the system Germany wide in the long run. In the past years a great variety of new and innovative payment systems have been introduced into the market. None of them however could gain a substantial market share and replace traditional payment methods. The aim of this dissertation was therefore to analyze if payment systems based on fingerprint technology have the potential to sustain in the market and if they might be able to supplement or even replace traditional payment systems. In order to assess digiPROOF a framework of success factors for payment systems was established in this dissertation. Subsequently a survey of users as well as non-users of the system was carried out and the digiPROOF system was evaluated according to the framework of success factors to draw a conclusion on whether fingerprint based payment systems are able to sustain successfully in the market and how the future payment market might look like. The approach of evaluating the system from a theoretical point of view through the framework of success factors and triangulating the results through empirical findings by questioning users as well as non-users allowed to draw a holistic picture and make a positive assumption on the future prospects of fingerprint based payment systems.

Payments are increasingly being made with payment cards rather than currency-this despite the fact that the operational cost of clearing a card payment usually exceeds the cost of transferring cash. In

this paper, the authors examine this puzzle through the lens of monetary theory. They consider the design of an optimal card-based payment system when cash is available as an alternative means of payment, and derive conditions under which cards will be preferred to cash. The authors find that a feature akin to the controversial "no-surcharge rule" may be necessary to ensure the viability of the card payment system. This rule, which is part of the contract between a card provider and a merchant, states that the merchant cannot charge a customer who pays by card more than a customer who pays by cash.

How could a small country in the middle of Europe, surrounded by much bigger countries and economic giants like Germany and France and in direct competition with North American and Asian rivals, develop world-class, cutting-edge financial markets? Swiss Finance answers this question, separating myth from reality, by explaining how Switzerland managed dramatic pressures brought to bear on its financial markets during the past two decades, perhaps none of them so great as the: · Competitive challenges caused by changes in Switzerland's banking secrecy laws and practices, · Shifting tide of new wealth generation toward Asia (e.g., China, Singapore, and South Korea), · Burdensome federal stamp and withholding taxes, and · Digitalization of the financial services industry, including cybersecurity, cryptocurrencies, smart contracts, central bank digital currencies, the FinTech revolution, and DLT applications. Swiss Finance thoroughly analyzes Swiss financial markets' successes and challenges. It covers critical topics for practitioners and academics to fully understand this unique development in world financial markets and private wealth administration.

Advances in Banking Technology and Management: Impacts of ICT and CRM

There is a widespread demand among businesses for more convenient and reliable international payment products, and inevitably this has led to calls for more predictable and consistent regulation of these products, especially in the light of such innovations as online payments and 'stored value' cards. Recognizing that recurring risks tend to be dealt with in similar ways by most legal regimes, this study – the first of its kind – draws on a detailed analysis of the strengths and weaknesses of existing regimes to develop an international model which incorporates both the legal elements and their practical application. In building his model, the author addresses the fundamental questions in the law of payment services: Who bears the risk of unauthorised payments? What must be done about claims of error? When are payments completed so that they discharge the underlying liability? When can payments be reversed? These issues are examined through in-depth descriptions of payment facilities as regulated in five key jurisdictions – Australia, the United Kingdom, the European Union, Singapore, and the United States – under the headings of scope, licensing, disclosure, obligations of the parties, liability, redress, and dispute resolution. The five regimes are further measured against the key harmonization project in this field, the UNCITRAL Model Law on Credit Transfers. The discussion is illustrated with analyses of leading cases and a number of worked examples. In summary, this very useful book synthesizes a logical and useful package of regulatory measures into a model that takes into account the lessons learnt in the regulation of payment services. Businesses will warmly welcome the study's contribution toward reducing the cost of taking a product to market across multiple jurisdictions. Policymakers and legislators will find the task of comparing the various approaches to payment services regulation and analyzing their effectiveness greatly facilitated.

Optimal Pricing of Payment Services when Cash is an Alternative

This paper presents a theoretical framework for analyzing pricing structures in debit card schemes featuring cardholders, retailers, their respective banks, and a network routing switch. The network routing switch controls the electronic debit card network and is jointly owned by the banks. In setting its prices, it needs to consider getting both consumers and retailers to participate in the market. In this two-sided market for debit cards, we show that the double-monopolistic network routing switch may want to supply consumers with cheap debit cards, deriving profits from charging a high retailer fee per transaction. This theoretic result resembles the current practice in the Netherlands where consumers pay no transaction fee, but retailers do. This corner solution carries over when we analyze socially optimal pricing.
