Textbook Of Veterinary Virology Textbook Student Edition

The study related to the viruses in animals is known as veterinary virology. It is a sub-field of veterinary medicine. Each animal species is affected by different types of viruses. However, there are also some viruses which can affect different species as well as both vertebrates and invertebrates. Some of the viruses which affect vertebrates are bluetongue virus, rabies virus and rhabdovirus. Bluetongue virus generally infects livestock while rabies virus can infect a large variety of animals such as dogs, monkeys, foxes and bats. Rhabdovirus is single stranded, negative sense RNA virus inheriting six genera that infect a wide variety of animals such as cattle, fish, horse, bovine, etc. Invertebrates such as honey bees are infected by deformed wing virus. This book contains some path-breaking studies in the field of veterinary virology. Different approaches, evaluations, methodologies and advanced studies on veterinary virology have been included herein. Researchers and students in this field will be assisted by the content of this book.

Veterinary Virology: An Evidence-Based Approach

Advances in biochemistry, molecular biology, virology, and structural biology have enabled the researchers in veterinary medicine to make many exciting discoveries that have, in some cases, conceptually revolutionized our understanding of the discipline. *Emerging Trends in Veterinary Virology* is a review of selected topics about viral infections in animals. 11 chapters cover recent findings about specific viruses that infect a variety of hosts. The contents cover several types of veterinary infections in birds (Infectious laryngotracheitis (ILT), avian leucosis), cats (feline rabies), dogs (canine distemper), bovines (viral leukemia) and equines (hendra virus disease). Additionally, special topics such as the epidemiology of veterinary zoonoses and SARS are also covered. The book provides updated information for researchers (virologists, microbiologists), students and veterinarians, alike.

Emerging Trends in Veterinary Virology

Veterinary virology is a major branch of veterinary medicine that studies viruses in non-human animals. Some of the viruses studied under this discipline are rhabdoviruses, foot and mouth disease viruses, pestiviruses, parvoviruses, coronaviruses, toroviruses and influenza etc. Rhabdoviruses are single stranded, negative sense RNA viruses which can infect a wide variety of animals. A few examples of rhabdoviruses are rabies virus and vesicular stomatitis virus. Foot and mouth disease viruses are non-enveloped, positive strand, RNA viruses that cause foot and mouth diseases in animals such as cattle, sheep and pigs. Pestiviruses are made up of single stranded, positive-sense RNA genomes. Diseases like classic swine fever and bovine viral diarrhea are caused due to these viruses. Parvoviruses are one of the tiniest viruses. They cause diseases in the gastrointestinal tract and lymphatic system. This book explores all the important aspects of veterinary virology. It also elucidates some of the vital pieces of work conducted across the world, on various topics related to this field. The extensive content of this book provides the readers with a thorough understanding of the subject.

Essentials of Veterinary Virology

Veterinary Virology deals with basic biomedical virology and the clinical discipline of infectious diseases. The book discusses the principles of virology as effecting future developments in the search for preventive and management of infectious diseases in animals, whether singly or as a whole herd or flock. Part I explains the principles of animal virology including the structure, composition, classification, nomenclature, cultivation, and assay of viruses. This part also discusses viral genetics, replication, and evolution (including mutation and genetic engineering). The book also reviews the pathogenesis of viruses, host resistance and susceptibility, as well as the mechanisms of persistent infections and tumor induction. Part II deals with viruses found in domestic animals; this part also explains in detail the properties, replication methods, pathogenesis, immunity, diagnosis, and control of some common viruses. The book discusses some other families of viruses of which no members are yet known as to have caused serious or important diseases in animals. Veterinarians, immunologists, virologists, molecular researchers, students, and academicians in the discipline of virology and cellular biology, as well as livestock owners will find this book helpful.

Case Studies in Veterinary Virology

Veterinary virology is a sub-discipline of veterinary medicine. It deals with the study of disease causing viruses and disorders in animals and non-human species. Viruses cannot reproduce independently, they can only reproduce inside the living cells of an organism. Most viruses contain single molecule of nucleic acid, surrounded by a protein coat known as capsid. Foot-and-mouth disease virus (FMDV), Bluetongue virus, influenza virus, African swine flu viruses are some of the causative agents of disease in animal species like pigs, cats, dogs and cattle. Viruses can also change the behavior of animal species to their own advantage. This book unravels the recent studies in the field of veterinary virology. It also provides interesting topics for research which interested readers can take up. This book, with its detailed analyses and data, will prove immensely beneficial to professionals and students involved in this area at various levels.

Veterinary Virology

Virology mainly focuses on the study of viruses which have a significant impact on living organisms. This book on veterinary virology provides comprehensive insights into various diseases which affect animals, like rhabdovirus, pestivirus, foot and mouth disease virus, etc. Suitable for the students and researchers of veterinary medicine and veterinary pathology, it will be a useful tool in comprehending various viral infections and their treatment. The book will also provide innovative topics for research which interested readers can take up.

Veterinary Virology: a Clinical Approach

Virology is the study of viruses causing infectious and contagious diseases in man and animals. There are many viral diseases namely FMD, PPR, sheep pox, goat pox, IBR, Bluetongue, swine fever, rabies, canine parvovirus etc prevalent in India affecting different species of animals and causing enormous economic losses.

Veterinary Virology

There are many viruses that affect the health of animals, and the field of study related to viruses in animals is known as veterinary virology. Some of these viruses have their own range and infect particular species. There are also some viruses which can affect different species. Veterinary virology focuses on the study of viruses like rhabdoviruses, foot and mouth disease viruses, circoviruses, herpes viruses and retroviruses. Rhabdoviruses are single stranded, negative sense RNA viruses inheriting six genera which infect a wide variety of plants and animals. Foot and mouth disease viruses are positive strand, non-enveloped, RNA viruses that can cause foot and mouth diseases in animals. Herpes viruses consist of ubiquitous pathogens which can infect both animals and humans. Retroviruses are a type of viruses that can cause cancer or immune deficiency. This book provides comprehensive insights into the field of veterinary virology. Its aim is to present researches that have transformed this discipline and aided its advancement. This book aims to serve as a resource guide for students and experts alike and contribute to the growth of the discipline.

Veterinary Virology: At A Glance

G. Petursson and Rikke Hoff-Jørgensen The concept of slow viral infections was first put forward in 1954 by Dr. Bjorn Sigurdsson, an Icelandic physician who had been studying some sheep diseases which were introduced into Iceland with the importation of a foreign breed of sheep in 1933. Sigurdsson's main criteria for defining slow infections were a very long initial period without clinical signs lasting months or even years following infection and a rather regular protracted, progressive course, once clinical symptoms had appeared, usually ending in serious disease or death. Sigurdsson included in this list of slow infections maedi-visna, infectious adenomatosis of sheep, scrapie in sheep, Bittner's mammary carcinoma and Gross' leukemia in mice. All of these diseases, except scrapie, are caused by retroviruses. The characteristics of slow infections as described above are of practical importance for epidemiology, diagnosis and control of these diseases. For many years the slow infections remained primarily a veterinary problem, mainly affecting sheep and goats in certain countries. In recent years, however, the human immunodeficiency virus (HIV) causing acquired immunodeficiency syndrome (AIDS), has suddenly appeared in many countries of the world and brought the slow infection concept forcefully to the attention of the medical profession. The disease problems and the economic effects of

slow infections of sheep and goats are increasingly recognized in various countries. For the reasons stated above we feel that this book should be useful for veterinarians and physicians alike.

Outline of Veterinary Virology

Most of the chapters of this book were written during 1987 which was the Diamond Jubilee year of the publication of the first reports of Newcastle disease in 1927. During the intervening years the nature of the Poultry Industry throughout the World has changed, or is in the process of changing, dramatically from one based on small village or farm flocks, frequently kept as a sideline, to an industry based on large flocks, sometimes consisting of hundreds of thousands of birds, run by multinational companies. To all these flocks, both large and small, Newcastle disease poses a considerable threat to their well-being and profitability and it is not unreasonable to state that hardly a single commercial flock of poultry is raised in the world without Newcastle disease having some effect due to actual disease, prophylactic vaccination or restrictions placed on rearing, movement, processing, sale or export of birds and products. In addition, recent years have produced developments in virology and associated biological technology which would have been unbelievable when Newcastle disease virus was first isolated. The economic importance of Newcastle disease virus and its use as a laboratory model has meant that major advances have been quickly applied to the field situation whenever possible and, as a result, a much fuller understanding, not only of the biochemistry and basic virology of the virus but also the ecology, epizootiology, antigenicity, immunology and other important aspects in the control of the disease has been achieved.

New Frontiers in Veterinary Virology

The influence of basic science, particularly molecular biology, in human and veterinary medicine revolutionized thinking in many aspects and changed fundamentally and creatively the classical strategy for research and prevention of infectious diseases. Genetic engineering and related disciplines have progressed to a remarkable degree over the last decade and now form the keystone supporting medicine. These are strong and efficient instruments for health and disease oriented research and their application gives the opportunity to receive more answers and not only more questions. The prime objective of this book is to create new knowledge within the medical disciplines and inspire colleagues working in this field with the unity and unambiguous importance of this science and its technologies for identifying, clarifying and planning new strategies for curing and preventing disease. This book contains original studies on the molecular biology of animal viruses. Some of the viruses discussed in this book are also hazardous to man. In this light it can be considered as a contribution to modern education on the human infectious diseases. From this point of view the book contains a chapter on Hantaan virus that causes no detectable disease in animals but hemorrhagic fever with renal syndrome has been attributed to infection of humans by this virus.

Maedi-Visna and Related Diseases

This book discusses the prominence and implication of the viral diseases that are a major threat to animals around the globe. A number of these diseases have also shown links with human populations, which has implications for public health. This book offers detailed and up-to-date information on viral diseases in livestock and poultry that were and/or are still a problem. Including cutting-edge developments, it also highlights several landmark contributions in the field of virology from India. Additionally, the book features tables and figures showing important clinical data and recommendations, with references for further information. It also explores the economic impact of viral diseases for farmers and the livestock industry, providing several examples. Further, it presents the latest information on viral diseases in global context, with a focus on state-of-art, molecular tools for the development of diagnostics, prophylactics and therapeutics. Lastly, the book also describes the challenges posed by the emerging and transboundary viral infections and our preparedness to counter them.

A Textbook of veterinary virology and viral diseases

This book is based on papers presented at the first scientific congress of the European Society for Veterinary Virology, which was attended by 230 delegates, and held at the University of Liege in Belgium from 5 to 7 April 1989. The main theme of the congress was "The Contribution of Molecular Biology to Veterinary Virology". The congress itself took the form of a series of keynote addresses by renowned scientists, together with selected papers from congress delegates, and a poster display. Three specialist sessions focussed respectively on the seal morbillivirus, bovine herpesvirus 1, and

bovine virus diarrhoea virus, while a small informal meeting reviewed current knowledge on rabbit haemorrhagic disease.

Newcastle Disease

This volume on enzootic bovine leukosis (EBL) and bovine leukemia virus (BLV) is the second in our series "Developments in Veterinary Virology". Each book in this series is devoted to a major virus disease of agricultural significance. The chapters in each volume are planned to supply information on a range of subjects from pathogenesis of the causative virus to vaccination, eradication, and rules regarding disease control. The present volume on enzootic bovine leukosis and bovine leukemia virus updates the reader on the disease and its causative agent and includes the nucleotide sequence of the BLV genome as well as data on its integration into the DNA of the tumor cell. Insights into diagnosis, veterinary legislation, and the economic aspects of EBL are also provided. Intense research conducted on EBL and BLV during the course of a decade is presented in a most concise and in-depth manner, so as to provide the reader with a comprehensive overview of this economically important disease of cattle. I wish to thank the editors, A. Burny and M. Mammerickx, as well as all the authors, for making this excellent book available at a stage when the knowledge on bovine leukemia virus will also contribute to our understanding of the virus causing human AIDS.

Textbook of Veterinary Virology

Rabies is an ancient disease and a fearsome one. Although it may not have the economic or public health importance of some other infectious diseases, few are so well known or carry the same emotional impact. Mainly transmitted by the bite of an enraged animal, and with practically no hope for recovery among those afflicted, it has provided the substance of stories and legends throughout the ages. The pioneering work of many 19th century workers, culminating in the development of the first rabies vaccines by Louis Pasteur, provided the ground work for the modern era in the study of rabies. Since then, and particularly in the last quarter century, considerable advances have been made in our knowledge of the nature of the infectious agent, its mode of transmission and pathogenetic mechanisms. Yet even today, much remains to be learned about the disease. For example, although effective vaccines exist for humans and other animals, there is still no known practical cure once the neurological disease symptoms develop. Markers of virulence have been mapped at the molecular level, but it is yet unclear as to how rabies virus actually exerts its pathological effects.

Virus Diseases in Laboratory and Captive Animals

This highly accessible textbook introduces readers to the development of viral vectors and discusses their application in veterinary vaccinology. It offers comprehensive information on the latest advances in this emerging research field, together with a broad overview of the history of veterinary vaccines and viral vectors. The book also addresses issues concerning funding, translational research and ethics that will impact the future development, manufacture and global use of viral vector-based veterinary vaccines. The book addresses the needs of graduate students and researchers in the fields of Veterinary Medicine, Virology and Immunology.

Veterinary Virology

The intention of the series Developments in Veterinary Virology is to provide monographs dealing with the major animal viral diseases. Each volume will include the latest achievements in fundamental research and practical applications and should be readable for people from various disciplines and different backgrounds. The multi-author approach provides the best opportunity to keep each chapter at the highest level and makes the composition of the volumes manageable to the editors. This monograph on Avian Leukosis presents comprehensive reviews on the recent history of avian retrovirus research, on epizootiological, virological, pathological aspects, on tumor induction, the immune response to avian retro viruses, virus-cell interactions and on techniques for diagnosis. The volume deals mainly with exogenous avian leukosis virus (ALV) infections, but one chapter is entirely devoted to endogenous avian leukemia virus. Molecular biology aspects are confined to various oncogenes and to lymphoma induction since retroviruses, including those specific for avian species, have recently been described in detail in the Cold Spring Harbor Laboratory series "Molecular Biology of Tumor Viruses". Two chapters are devoted to the practical application of insights obtained from avian leukosis research: influences of ALV infection on production performance and eradication procedures.

3rd Veterinary Herpesvirus Symposium of the European Society for Veterinary Virology (ESVV)

Hardbound. As its title suggests, this book is intended to give exhaustive information on virus infections and diseases occurring in ruminants. Each virus and corresponding disease is described in a separate chapter, and the chapters are ordered according to current virus classification. Contributing authors are experts on the virus and disease they describe. Where necessary, the text is accompanied by tables and pictures. The accent is placed on diagnosis of the disease by clinical observations including epizootological data. There is also a description of the laboratory procedures of diagnostic virology, and suggestions concerning control measures (e.g. vaccination and/or eradication policy). This book should prove indispensable to: the practising veterinarian, by facilitating recognition of a viral disease, and giving advice on collecting appropriate specimens for laboratory investigation; the veterinary virologist by aiding the choice of appropriate

Recent Advances in Animal Virology

Take a disease of complex pathology with inflammatory and neoplastic features, which affects lymphoid and neural tissues, belonging to a disease group which killed one chicken in five, and which defied efforts to understand and control it for more than 50 years, and one can begin to appreciate the interest Marek's disease has received. Can you add these characteristics with the finding of the causal herpesvirus, its recognition as the neoplasm first discovered to be so caused, and its prevention by vaccination, and the special place of Marek's disease in veterinary medicine and comparative oncology becomes clear. This book sets out to provide an authoritative and comprehensive account of knowledge of Marek's disease and its control. I hope that it will be of value to veterinary research workers, teachers and students who need information about the disease, to veterinarians, poultrymen and vaccine manufacturers who have to diagnose and control it, and to oncologists in other fields interested in comparative aspects. Other reviews of the disease exist, of course, but this is the first multi-authored book devoted to the subject.
