Check these out **How To Do 1000 Reps a Day for 4 Weeks** · <https://youtu.be/ofqqOeZ93I4>**How To Build ...**

So number one is that alcohol itself carries a caloric value, which means one gram of alcohol has seven calories. So if you're on a calorie diet, if you count your calories, means that whatever amount of alcohol you drink, you will need to add into your calorie account. So just to compare, carbohydrates and protein have around four calories a gram, and fat has nine calories a gram.

Number two, and this is, I think, the most important bit. I really want you to understand this point, so make sure you pay attention. Another wink here. So alcohol has no nutritional value, which means your body cannot use it at all. So the first thing your body wants to do is get rid of it. Because it has no nutritional value means also your body cannot store it. So what happens? As you drink alcohol, it's getting broken down by your liver, and now, let's think about the liver, and this is the important bit I want you to get, because you're going to realize in a second. Now your liver breaks down the alcohol, metabolizes it on a basis of one unit per hour, breaks it down, which is fine. That sounds good...

Number three, alcohol is a toxin, and as it is a toxin, it affects or damages our stomach linings, the intestines, your kidneys, and your liver. Now why is that bad, and how does that affect your weight loss? Well, when you think about it, if you eat food, most of the time it will get broken down in your stomach a little bit, then in the small intestine, large intestine, and so on.

Number four, alcohol lowers testosterone. Now testosterone is known as the hormone or our muscle-building hormone in your body, and also as sort of a fat-burning hormone. Now I'm not going to go into more detail about it, but how does that translate? Well, if you have more muscle in your body, it raises your metabolic rate, and as you have a higher metabolic rate, you will burn more fat.

How Alcohol Affects the Liver & Body to limit your Weight Loss! (+STOPS FAT LOSS!) - How Alcohol Affects the Liver & Body to limit your Weight Loss! (+STOPS FAT LOSS!) by Marc Dressen 408,490 views 9 years ago 11 minutes, 9 seconds - Liked this one? Check these out <https://youtu.be/ofqqOeZ93I4> How To Do 1000 Reps a Day for 4 Weeks · <https://youtu.be/ofqqOeZ93I4> How To Build ...

So number one is that alcohol itself carries a caloric value, which means one gram of alcohol has seven calories. So if you're on a calorie diet, if you count your calories, means that whatever amount of alcohol you drink, you will need to add into your calorie account. So just to compare, carbohydrates and protein have around four calories a gram, and fat has nine calories a gram.

Number two, and this is, I think, the most important bit. I really want you to understand this point, so make sure you pay attention. Another wink here. So alcohol has no nutritional value, which means your body cannot use it at all. So the first thing your body wants to do is get rid of it. Because it has no nutritional value means also your body cannot store it. So what happens? As you drink alcohol, it's getting broken down by your liver, and now, let's think about the liver, and this is the important bit I want you to get, because you're going to realize in a second. Now your liver breaks down the alcohol, metabolizes it on a basis of one unit per hour, breaks it down, which is fine. That sounds good...

Number three, alcohol is a toxin, and as it is a toxin, it affects or damages our stomach linings, the intestines, your kidneys, and your liver. Now why is that bad, and how does that affect your weight loss? Well, when you think about it, if you eat food, most of the time it will get broken down in your stomach a little bit, then in the small intestine, large intestine, and so on.

Number four, alcohol lowers testosterone. Now testosterone is known as the hormone or our muscle-building hormone in your body, and also as sort of a fat-burning hormone. Now I'm not going to go into more detail about it, but how does that translate? Well, if you have more muscle in your body, it raises your metabolic rate, and as you have a higher metabolic rate, you will burn more fat. Major Muscles of the Human Body - Major Muscles of the Human Body by MooMooMath and Science 638,380 views 4 years ago 4 minutes, 3 seconds - Sorry I made a mistake at 00:49 I incorrectly label and describe the thigh adductors as hip abductors. The thigh adductors pull the ...  
The Bicep is a large muscle that lies on the front of the upper arm between the shoulder and the elbow.

The abdominal muscles support the trunk, allow movement and hold organs in place

The sartorius muscle is the longest muscle in the human body.

The trapezius muscle resembles a trapezoid or diamond-shaped quadrilateral

The Deltoid forms the rounded contour of the human shoulder.

The latissimus dorsi is the largest muscle in the upper body. It is responsible for extension, adduction, internal rotation of the shoulder.

The serratus anterior is a muscle that originates on the surface of the 1st to 8th ribs at the side of the chest.

The brachioradialis is a muscle of the forearm that flexes the forearm at the elbow.

Quadriceps is a large muscle group that includes the four prevailing muscles on the front of the thigh.

The gastrocnemius forms half of the calf muscle.

Tibialis anterior It is responsible for flexing the foot backward and inverting the foot.

The infraspinatus muscle is a thick triangular muscle. It is one of the four muscles of the rotator cuff, its main function is to rotate the humerus and stabilize the shoulder joint.

Triceps is a large muscle on the back of the upper arm. It is responsible for straightening the arm.

The gluteus medius is a muscle that helps with hip movement

What Happens To Your Body When You Stop Drinking Alcohol - What Happens To Your Body When You Stop Drinking Alcohol by Body Hub 38,939 views 2 years ago 9 minutes, 46 seconds - Alcohol, is a toxin. When it enters the bloodstream, it affects every organ system and disrupts the normal processes of the body.

What Happens To Your Body When You Stop Drinking Alcohol

When it enters the bloodstream, it affects every organ system and disrupts the normal processes of the body

Many people realize that alcohol consumption is a health hazard

Better Sleep

It can even increase the chemical adenosine, which affects sleep regulation

Reduced Weight

The thing with alcohol is that it can increase your daily calorie intake without your notice

Clearer Skin

The more alcohol you drink, the less water your body has

Enhanced Immune System

A Stronger Heart

Heavy and regular drinking can damage the heart and weaken its muscles

And with alcohol in the system, the transport of toxins through intestinal walls increases

Remember that the liver cleanses the body of toxins including alcohol

Healthier Kidneys

Decreased Cancer Risk

Reduced Anxiety

Alcohol is a depressant

Improve Memory And Cognitive Function

This condition especially affects the parts associated with learning and cognition
